¿Qué sabemos?

*Que tenemos unos 3 mil millones de pares de bases (A,C,T, G)

*Que un gen tiene de media 3000 bases pero varía mucho su tamaño

*Que el número de genes total que tenemos es alrededor de 26,000

*Que los seres humanos somos un 99,9% idénticos

*Que sólo el 2% del genoma codifica para proteínas

*Que la mayoría del ADN es no codificante

*Que sobre un 50% del ADN son frases que se repiten (mucho más que ninguna otra especie)

¿Qué no sabemos?

*El número exacto de los genes

*La función de la mayoría

*La manera como interaccionan

*La mayoría de los genes implicados en enfermedades comunes

*Muchas de las funciones del ADN no codificante

*La coordinación exacta de la expresión génica, síntesis de proteínas y eventos postraslacionales.

*El proteoma (Contenido total de proteínas, su función e interrelaciones)

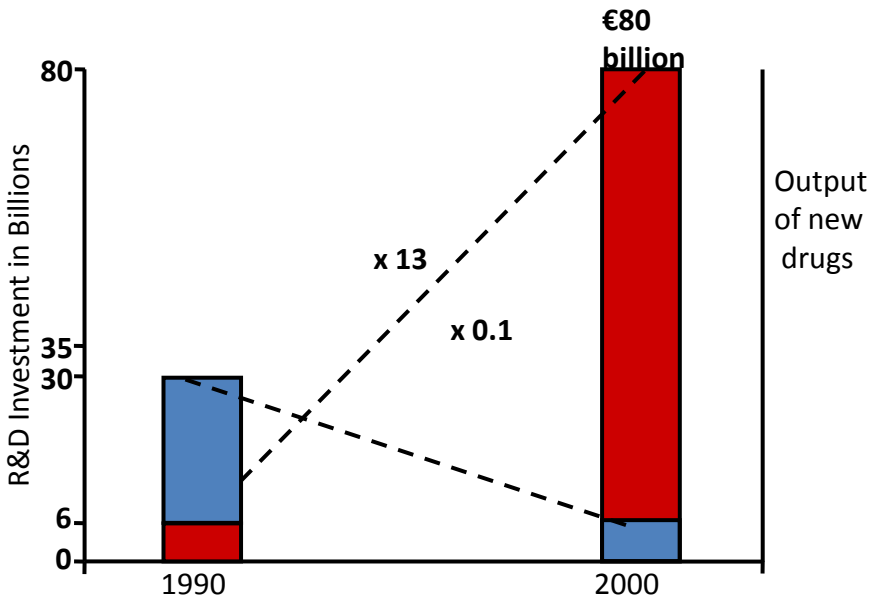
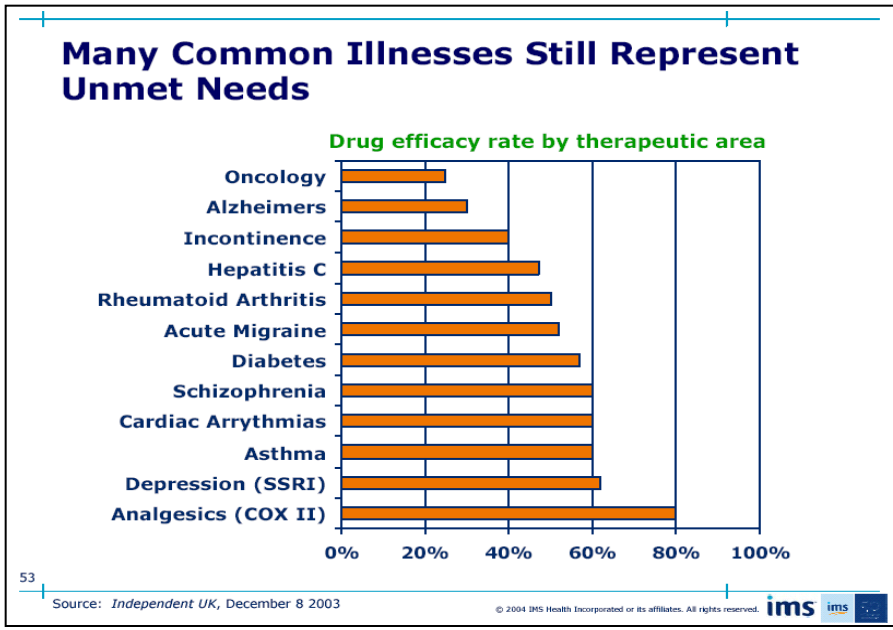
THE HUMAN VARIOME PROJECT

Our knowledge of the etiopathogenesis of the disease is limited

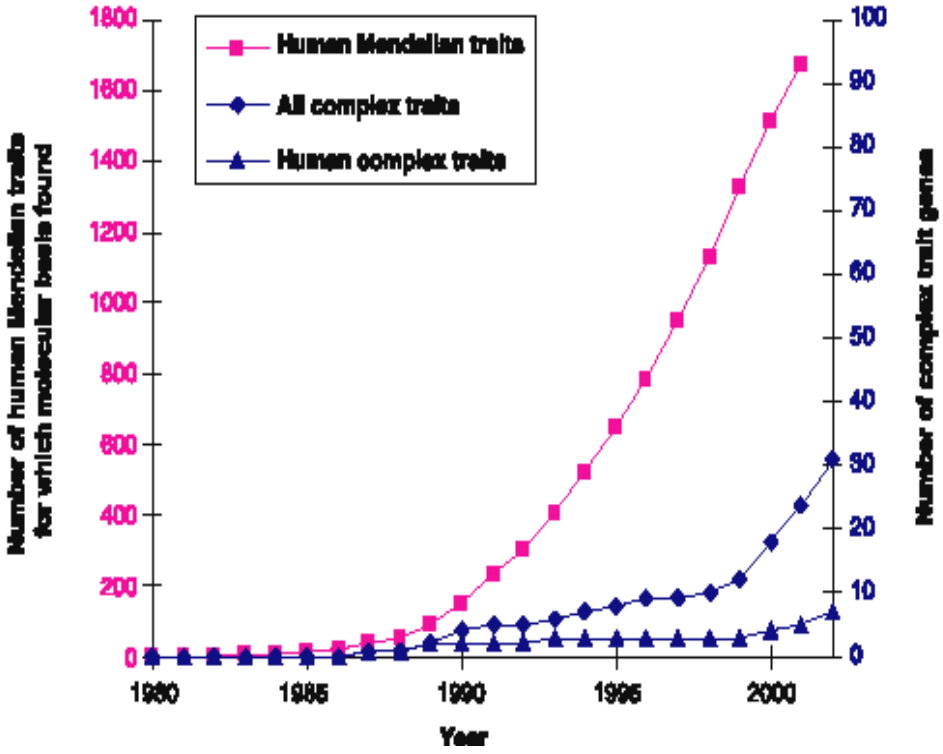
Our classification of diseases is mainly based in signs and symptoms

Limited therapeutic efficacy in many TAs



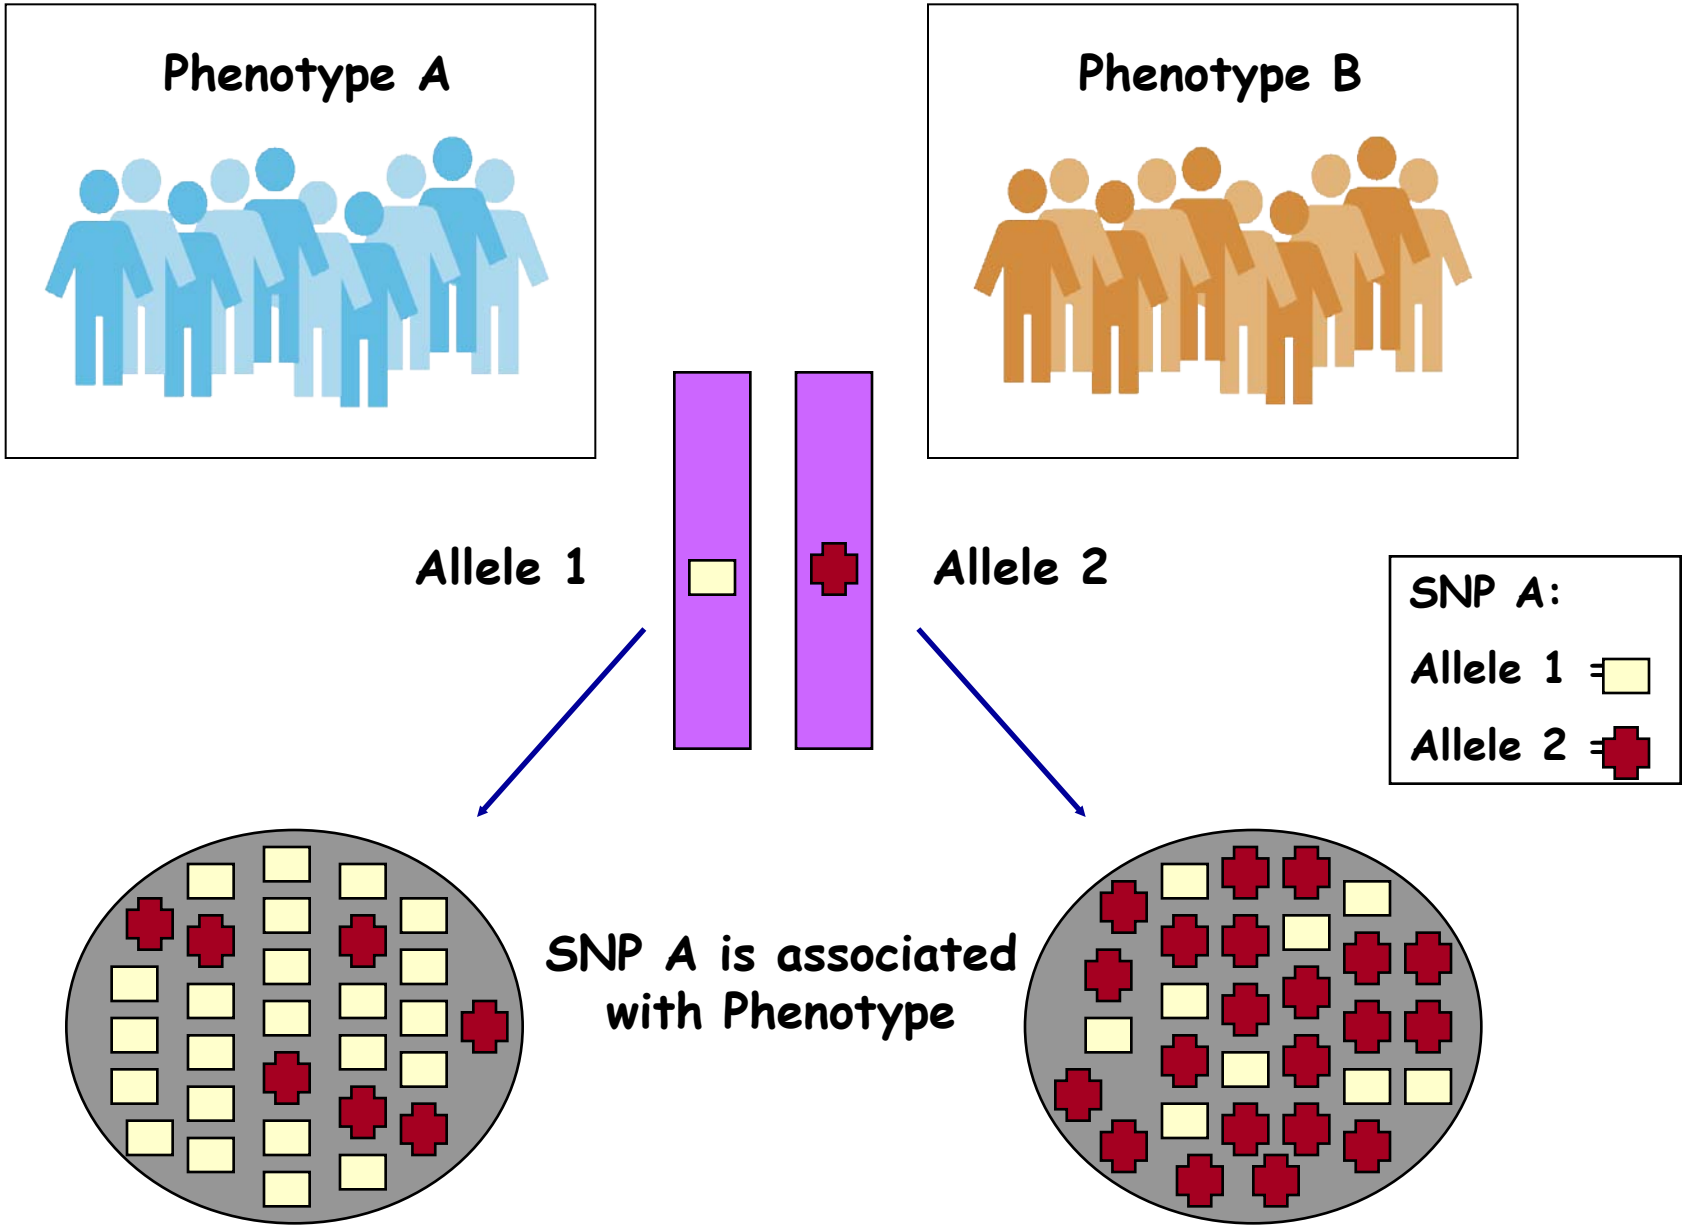


Using genetics to find genes that underlie complex traits (such as cancer) is a potential useful tool for a better understanding of the disease and pharmacogenetics and pharmacogenomics

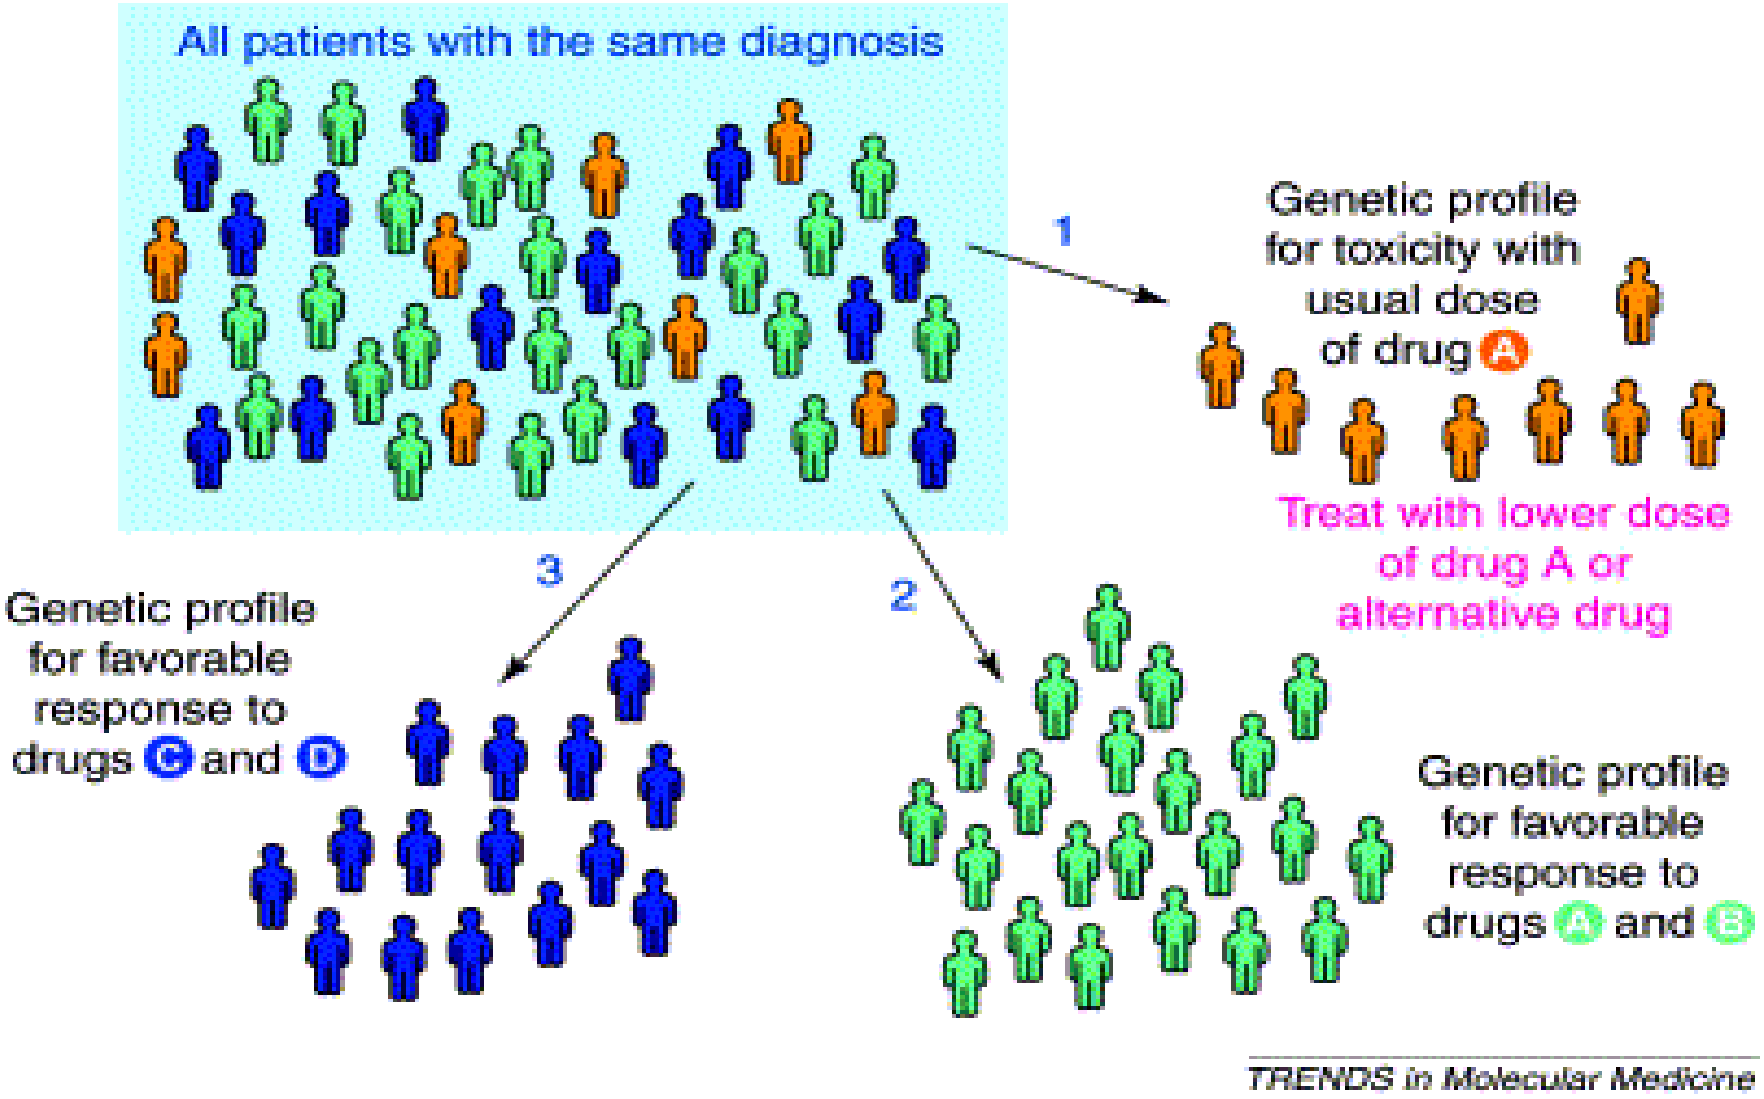


But still the advance in knowledge ir genes involved in complex traits is limited !

Human Genetic Association Study Design



Genotyping means patient classification



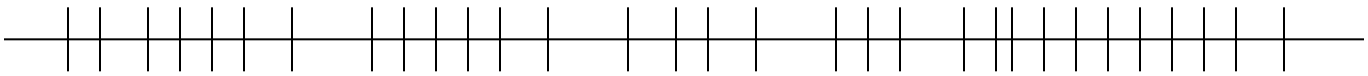
SNP: SINGLE NUCLEOTIDE POLYMORPHISM

ATCGGCGTACCTGATTCCGAATCCGTATCG
ATCGGCGTACCTGAATCCGAATCCGTATCG

Distribution: 1 every 250bp

>10 million SNPs in the human genome (around 6M validated)->11M in dbDNP

Mutation rate: 10^{-7}

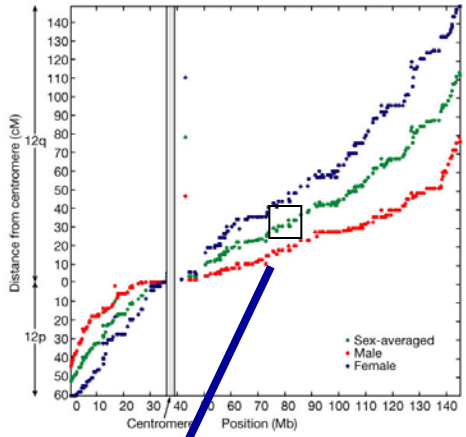


Human DNA

A SNP MAP

Characteristics of SNP Variation

- Clustering is observed on all the autosomes: Haplotype blocks: Blocks with little evidence of recombination
- Some clusters appear functional : MHC on chromosome 6 (with extensive replication)



LD blocks (little or no recombination)

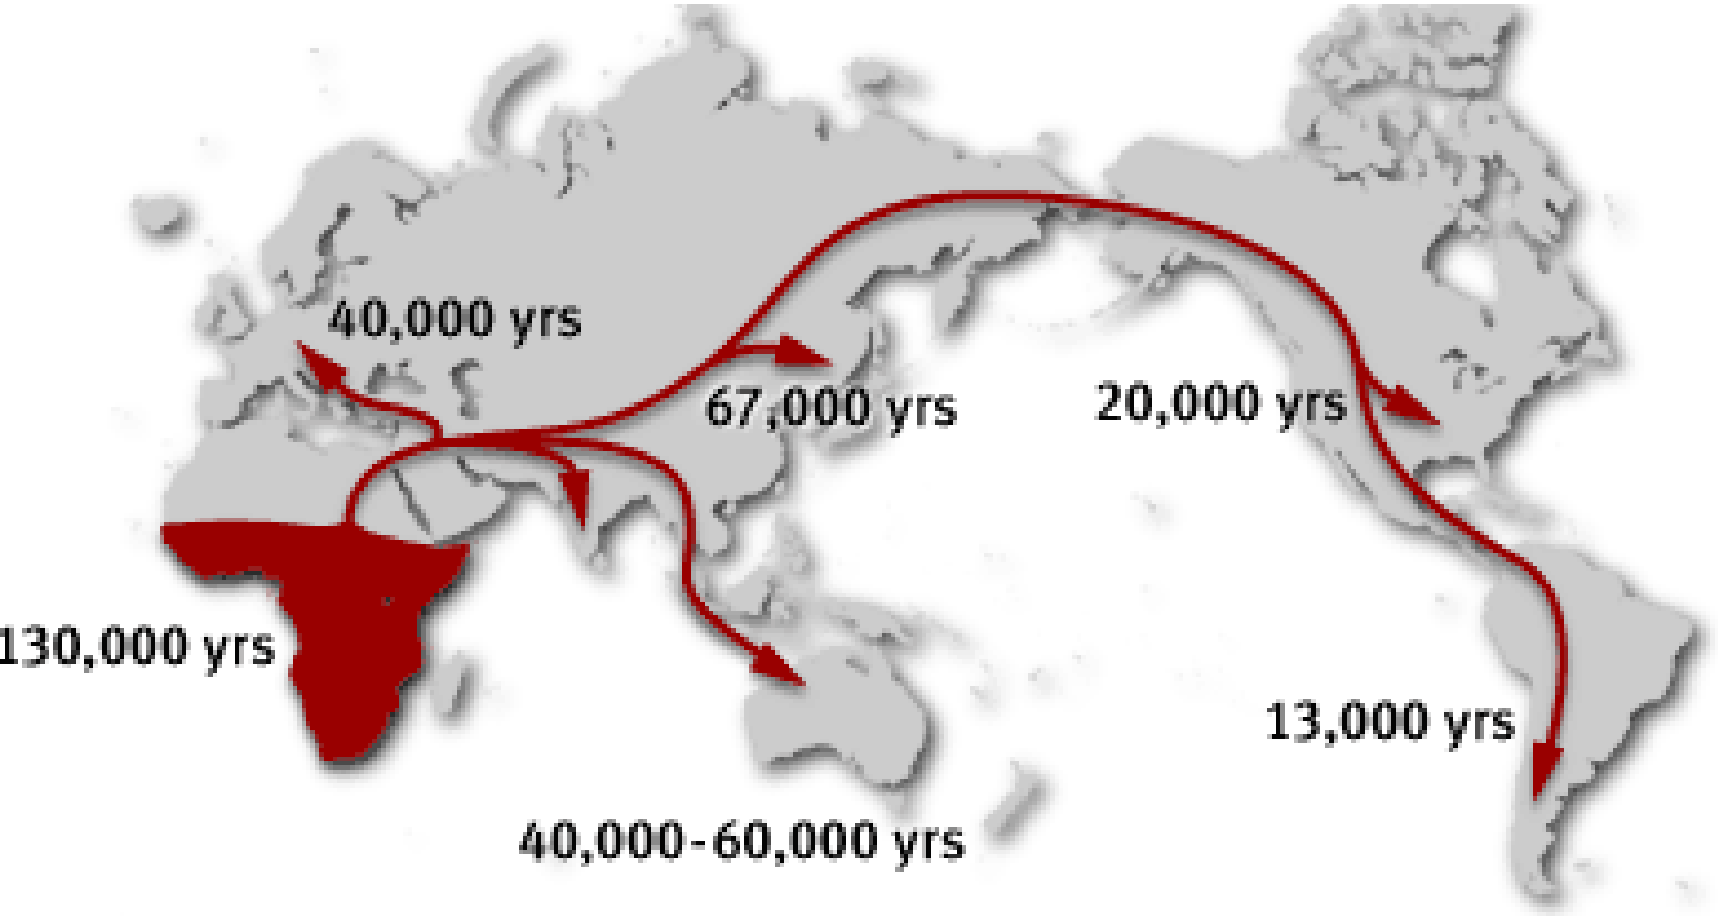
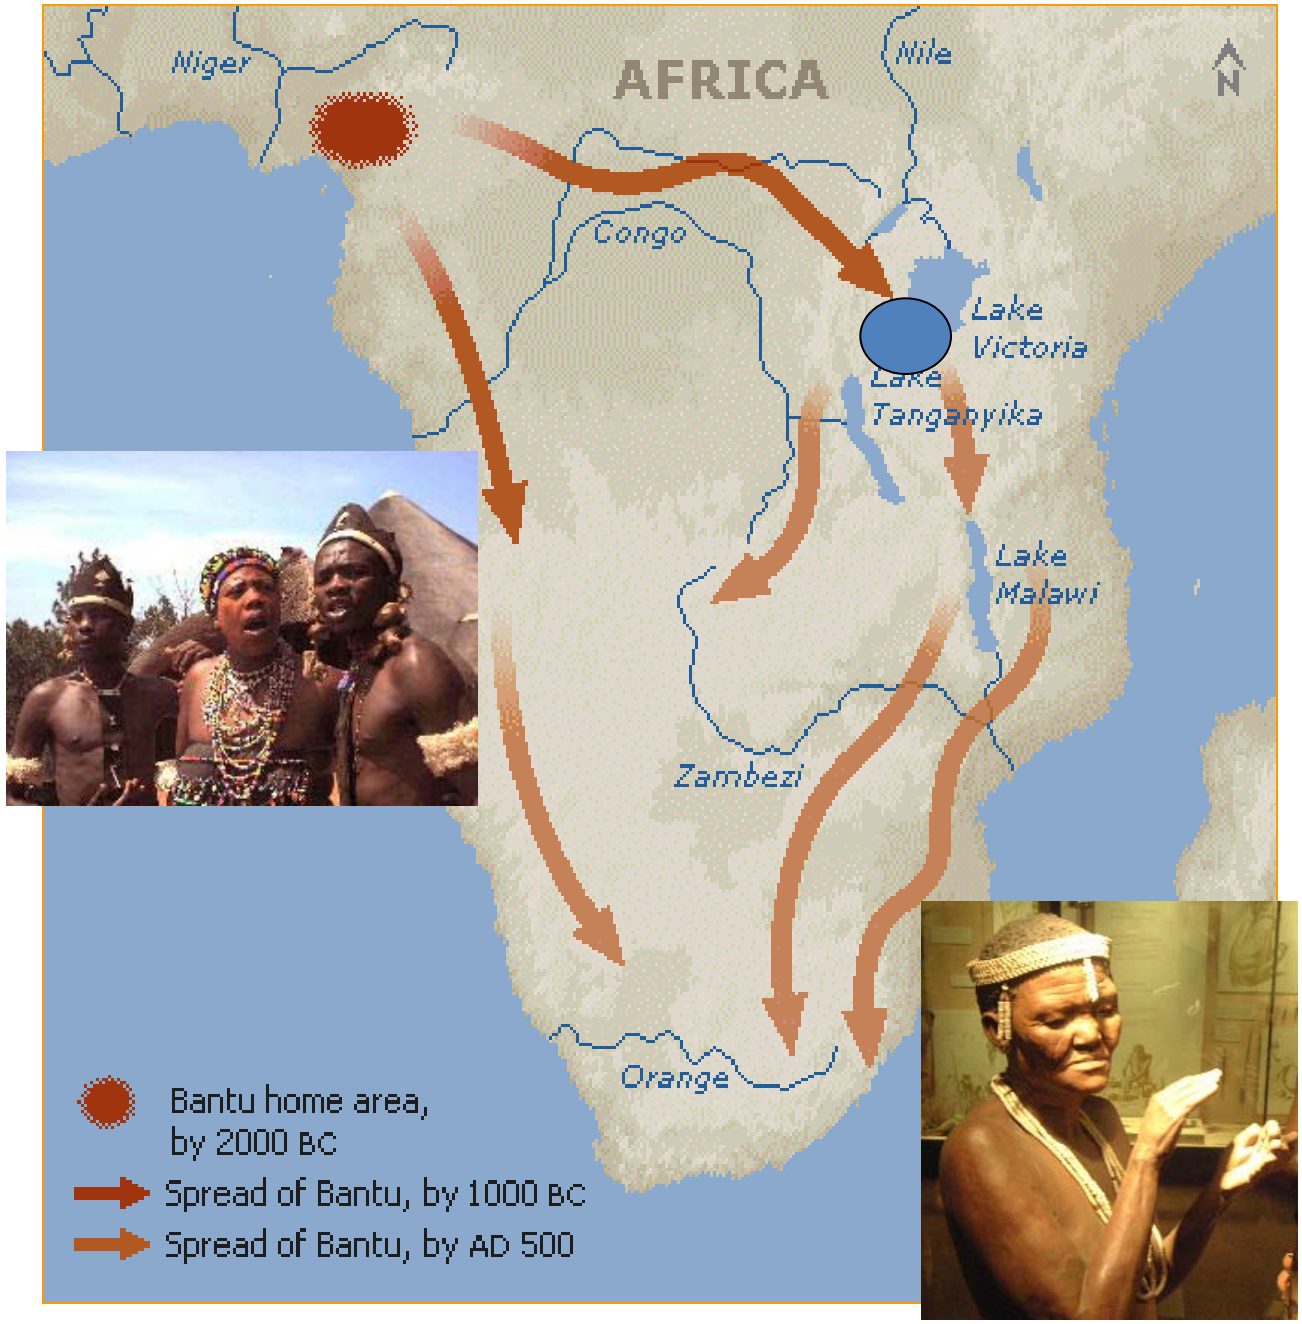
“Out of Africa”





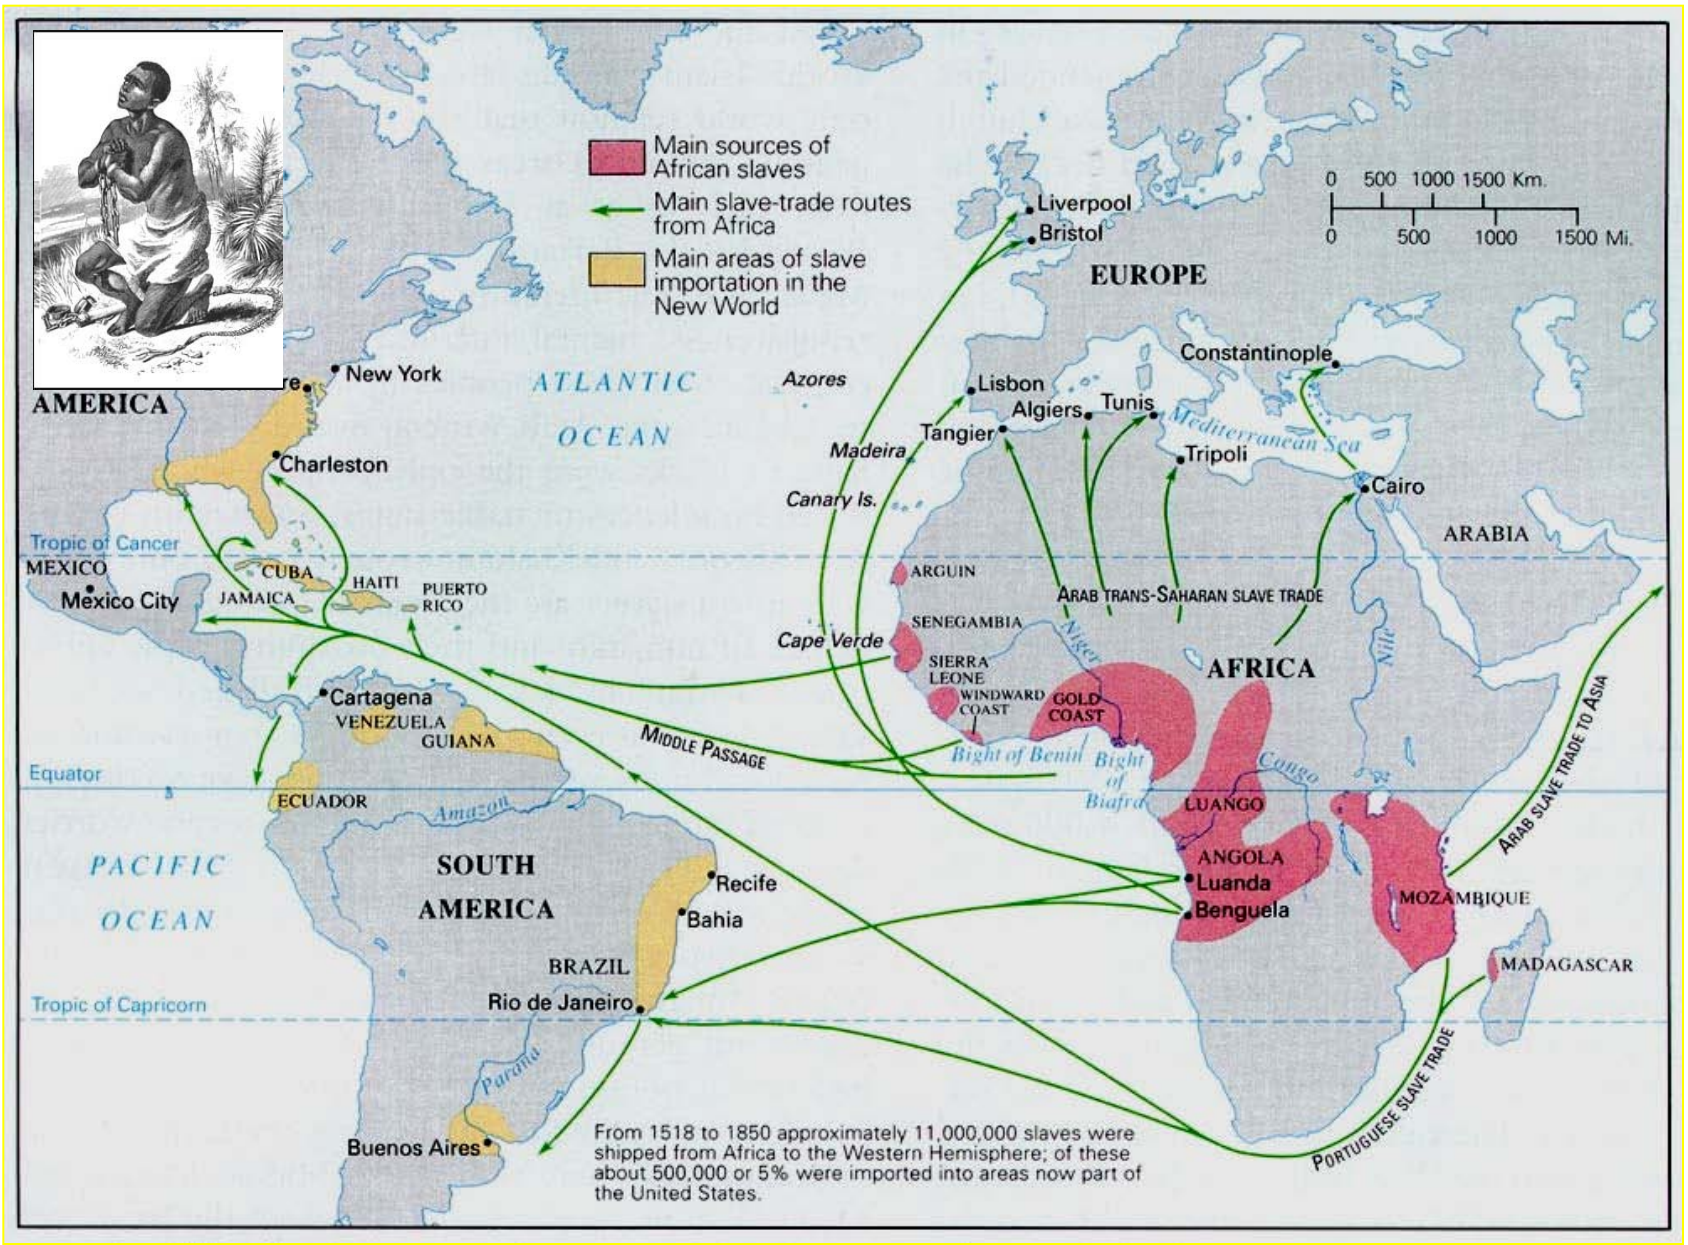
Bantu farmers adopted invented a type of grain that grows in winter as opposite to the Mediterrenean type of agriculture.

Later on they developped new technologies which would give them clear advantages during the expansion:

.- iron making

.- growing of domesticated bananas and plantains (north-eastern corner of equatorial rain forest)

mtDNA signature of SLAVE TRADE



Northern Europe was gradually recolonized from refugia after the Last Glacial Maximum (LGM), ~20,000 years ago (Housley et al. 1997). The two major refugia were in southwestern France/Cantabria (Atlantic and western Mediterranean zone) and Ukraine/Central Russian Plain (Periglacial zone), but other minor refugia could have existed in between (Dolukhanov 2000).
